

Some OctetString values are not received as expected, why?

First of all, the values are received correctly! The problem seems to occur because of an undefined non-printable-escape-character and the resulting OctetString.toString() formatting.

To always get the **byte values**, use `OctetString.getValue()` or `OctetString.toByteArray()` methods only.

The following code snippet from a SNMP4J unit test illustrates how `OctetString.toString()` formats non-printable values:

OctetString Formatting

```
String HEX_STRING = "1C:32:41:00:4E:38";
OctetString nonPrintable = OctetString.fromHexString(HEX_STRING);
assertFalse(nonPrintable.isPrintable());
assertEquals(HEX_STRING.toLowerCase(), nonPrintable.toString());
SNMP4JSettings.setDefaultNonPrintableEscapeCharacter('_');
assertEquals("_2A_N8", nonPrintable.toString());
SNMP4JSettings.setDefaultNonPrintableEscapeCharacter(null);
assertEquals(HEX_STRING.toLowerCase(), nonPrintable.toString());
```
